

# **ETHAGET WHITE PAPER v1.2**

## Introduction

EthaGet is a client-side interface that allows users to interact directly with the Ethereum blockchain, without having to join a centralized exchange.

## What is EthaGet?

EthaGet is an Ethereum wallet with a focus on security, privacy and ease of use!!!

*With EthaGet users can:*

- Create a new ETH wallet.
- Send and receive ETH and ERC20 tokens.
- Access a variety of existing wallets including our soon to be released GETI PROTOCOL, MetaMask, and partnering hardware wallets.
- Swap a growing number of cryptocurrencies including ERC20 tokens, ETH, ETC, BTC, and REP.
- Deploy and interact with smart contracts.
- Send offline, through the use of signatures.
- Initialize, bid on, and finalize ENS domain auctions.

## Getti Protocol

The “Geti Protocol” is an original development by the EthaGet Team. Geti is a system that works over the top of the Ethereum blockchain to ensure complete privacy, security and anonymity!

The Geti Protocol works much in the same way as the PGP key for emailing. A user will have a public key that other users will need to send transactions, and also a private key to unlock the wallet. With Geti, no one will ever know your ETH address, in fact your ETH address will be changing constantly, so it's impossible for others to keep track of your activity.

Geti is optional on the EthaGet wallet, but is an important innovation for those that value privacy and security.

More details on the “Geti Protocol” will be released in December 2019 (White Paper v1.3) ahead of our January launch.

### **Are my funds secure?**

EthaGet don't have access to any of your funds or information.

Your funds and information are not ‘in’ the EthaGet Wallet. Your wallet exists on the Ethereum blockchain, EthaGet just offers a way for anyone to interact with the blockchain easily. If EthaGet went down, you would simply have to find another Ethereum blockchain interface that would allow you to access your wallet.

The information used to unlock your EthaGet wallet is the same information that can be used to unlock your wallet on another platform.

Our primary focus on privacy and security and we are working to further enhance these features for our users; hence the “Geti Protocol”.

### **EthaDollar**

Etha Dollar is a stable coin backed by the U.S. Dollar at a rate of 1ETD / \$1. The Etha Dollar serves as a bridge between Ethereum including tokens based on the Ethereum network and fiat currency.

Etha Dollar offers a staking reward of 1% per month for all token holders. These rewards are sent automatically to holders Ethereum address each month.

Etha Dollar is the main currency pair used in the soon to be released Decentralized Exchange "EthaDex". Ads on EthaGet, EthaDex and EthaPay are all paid for by EthaDollar (ETD).

Name: Etha Dollar

Ticker: ETD

Decimals: 18

Initial Supply: 30,000,000 ETD

Max Supply: 400,000,000 ETD

Price Ratio: 1ETD : \$1USD

Staking rate: 1% per month

### **Staking @ 1% per month**

ETD is one of the first stable coins to offer staking rewards. This offers more stability than other stable coins but also a guaranteed reward for holding tokens.

Rewards are paid directly into your Ethereum wallet at the end of each month. You will receive 1% of your total ETD balance each month!

In December 2019, our automated open source smart contract will handle reward/staking payments at the end of each month. At this point, all funds kept in our cold wallet will be transferred into this smart contract for security and transparency!

### **EthaDex**

EthaDex is currently under development and is scheduled to be unveiled in December 2019.

EthaDex is the first truly on-chain DEX and will incorporate the EthaGet Wallet and the “Geti Protocol”

EthaDex interacts directly with the Ethereum blockchain so all trades are done on chain. Other DEX in the market have a smart contract that traders must deposit funds before they make trades. This process involves more time and fees to be wasted. EthaDex being 100% on chain means that you initiate a trade from your wallet and receive funds directly into your wallet so there is no double handling on every trade!

More details on EthaDex will be released in December 2019 (White Paper v1.3) ahead of our January launch.

### **EthaPay**

EthaPay is scheduled to be released in March 2020.

EthaPay is a fast, easy P2P money transfer system where users can send ETD (EthaDollar) to users instantly all over the world via the Geti Protocol and receive FIAT currency or other top cryptocurrencies.

### **Conclusion**

EthaGet has set out to increase privacy, security, and anonymity of the Ethereum Wallet, Decentralized Exchanges and P2P money transfers. The end result is a simpler, more enjoyable user experience!
